

### 3. Data Collection and Preprocessing Phase

Date	03 Oct 2025
Team ID	xxxxxx
Project Title	Analysis and Visualization of Global Food Production Data (1961–2023)
Maximum Marks	10 Marks

#### 3.1. Data Exploration and Preprocessing

Identifies data sources, assesses quality issues like missing values and duplicates, and implements resolution plans to ensure accurate and reliable analysis.

Section	Description
Data Overview	<p>The dataset contains <b>11,912 rows and 24 columns</b>, covering <b>global food production trends from 1961 to 2023</b>. It includes multiple commodities such as cereals (rice, wheat, maize), fruits (grapes, apples, bananas, oranges, avocados), and other agricultural products (tea, coffee, cocoa, yams, potatoes, chicken meat, palm oil, etc.).</p> <ul style="list-style-type: none"> <li>• <b>Entity:</b> Country/Region name</li> <li>• <b>Year:</b> 1961–2023</li> <li>• <b>Production columns:</b> 22 commodities measured in <b>tonnes</b></li> </ul>
Data Cleaning	<p><b>Missing Values:</b> Checked for null entries; dataset was found to have complete records.</p> <p><b>Duplicates:</b> No duplicate rows detected for (Entity, Year) pairs.</p> <p><b>Outliers:</b> Extreme values were detected in certain production volumes. Outlier handling was performed</p>

	<p>by:</p> <ul style="list-style-type: none"> <li>Validating unusually high values against global averages.</li> <li>Applying <b>visual inspections in Power BI</b> and removing/adjusting anomalies.</li> </ul> <p><b>Error Corrections:</b> Minor inconsistencies in column naming were standardized (spacing in column names).</p>
Data Transformation	<p><b>Power Query</b> in Power BI was used for:</p> <ul style="list-style-type: none"> <li><b>Filtering</b> unnecessary attributes.</li> <li><b>Sorting</b> commodities by year/production</li> </ul>
Data Type Conversion	<ul style="list-style-type: none"> <li>Converted all <b>production columns</b> to numerical data type (<b>Whole number</b>) for accurate aggregation.</li> <li>Converted <b>Year</b> to <b>date/time hierarchy</b> for time-series analysis in Power BI.</li> <li>Ensured <b>Entity</b> is stored as categorical (text) for grouping.</li> </ul>
Column Splitting and Merging	<ul style="list-style-type: none"> <li>Standardized column names by removing extra spaces (e.g., Rice Production ( tonnes) → Rice Production (tonnes)).</li> <li>Merged similar category fields for uniform visualization.</li> </ul>
Save Processed Data	<ul style="list-style-type: none"> <li>Final cleaned dataset was saved in <b>Power BI Data Model</b>.</li> <li>Processed file also exported as <b>CSV</b> for backup.</li> </ul>
